Solid Tints and Dyes

Fashionable and reduce the amount of light coming through the lenses

Plastic Gradient Dyes

Usually dark at the top and gradually lighten toward the bottom of the lenses

UV Protection

Can block 98-100% of transmitted and reflected UVA and UVB rays

Scratch-resistant Coating

Applied to plastic lenses to increase their resistance to normal scratching and pitting

Polycarbonate Lenses

One of the thinnest, lightest, and most impact-resistant materials available; plus, they provide UV protection and scratch resistance

Anti-reflective Coating

Can reduce eyestrain caused by glare, reflections, blue light exposure from digital devices, and the "halos" you see around lights at night; plus, it helps protect lenses from scratches, smudges, dust, and water

Photochromic Lenses

Automatically darken when exposed to sunlight and lighten when out of sunlight

Progressive Lenses

Line-free lenses that gradually change power with distance
